You *deserve* to benefit from the durability, simplicity and accuracy an Allen Custom Drill delivers...

THE CHOICE IS YOURS...

- Proven T-boot System
- Renowned Accord metering and distribution system
- 5" or 6" row spacings
- 3m to 8m widths, folding to 3m transport width
- Various bin options: fertilizer, insecticide and slug bait
- Crane option for loading of 500kg bulk bags

...superior seeding results.

An air seeder system doesn't rely solely on gravity, so blocked hoses are never an issue to get every last grain into the ground exactly where it is intended and at the correct rates.

Another great advantage is that you only have one seeder to look after, so you can trust it is still distributing the seed evenly out of every hose. Even with only a couple handfuls of seed left in the hopper.

The new series has a significantly lower cost and horse power requirement than our Disc drills. So they are a lot more appealing to everyone.

They also offer simple and accurate calibration of seeding rates from as low as 500g to 350kg/ha plus. But the essential point of difference lies in the ground. The new drills feature 25mm coil tines with tungsten tipped T-boots.

Other features...

...of the T-D Series are the low bin filling height with large hopper capacities for ease of filling with 500kg bulk bags; a large loading platform; durable but light construction, and an electronic area meter and fan RPM readout, which all come as standard.

The new drills also offer many options like fertiliser and insecticide boxes, rear tow bar, harrows and cranes for loading of bulk bags.
